

Durability and Performance from Top to Bottom

40+ Years of Proven Performance

Plytanium® plywood is strong, tough, and stands up against wind and rain. That makes it an ideal material for walls, sub-floors and roofs. And we have the track record to prove it.

Georgia-Pacific makes more Southern Pine plywood than anyone else in the United States, and we've been doing it since 1964. Plytanium plywood sheathing and sub-floor products carry a lifetime limited warranty against delamination.*

That's performance you and your customers can count on.

Reliable Protection Overhead

The nail-holding, moisture-forgiveness, and long-term load carrying benefits of Plytanium plywood also make it ideal for roof applications. Plytanium plywood holds shingles firmly and its use virtually eliminates the "telegraphing" issue that can occur with other structural sheathing. Its impact resistance properties make Plytanium plywood ideal for use in high wind zones. In fact, in the hurricane-prone south Florida counties of Dade and Broward, where building codes are among the strictest, plywood is the required wood panel for roof sheathing applications.

Firmer Feel Underfoot

Plytanium Sturd-I-Floor® plywood provides the performance properties and certified APA quality needed for sub-floor applications. Plytanium holds nails firmly, minimizing nail pops that can lead to squeaky floors. With its smooth, all-wood surface,

Plytanium plywood also acts as an excellent adhesion base for a wide range of flooring materials, including hardwood, carpet, vinyl, and tile. And because plywood is 10% stiffer than OSB, it decreases the probability of tile cracking and soft, springy floors.
